

Why should you care about writing Reactive Mobile Apps?

Mark Allibone

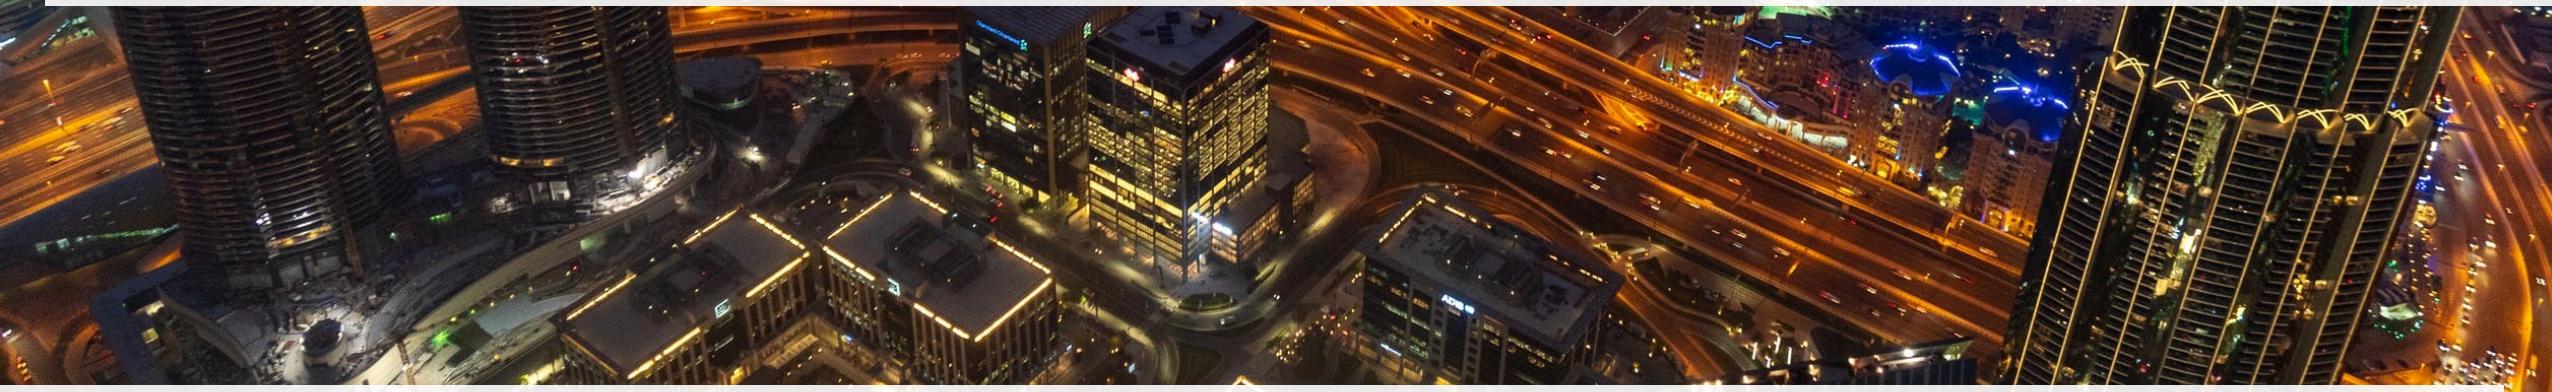

Rey Technology

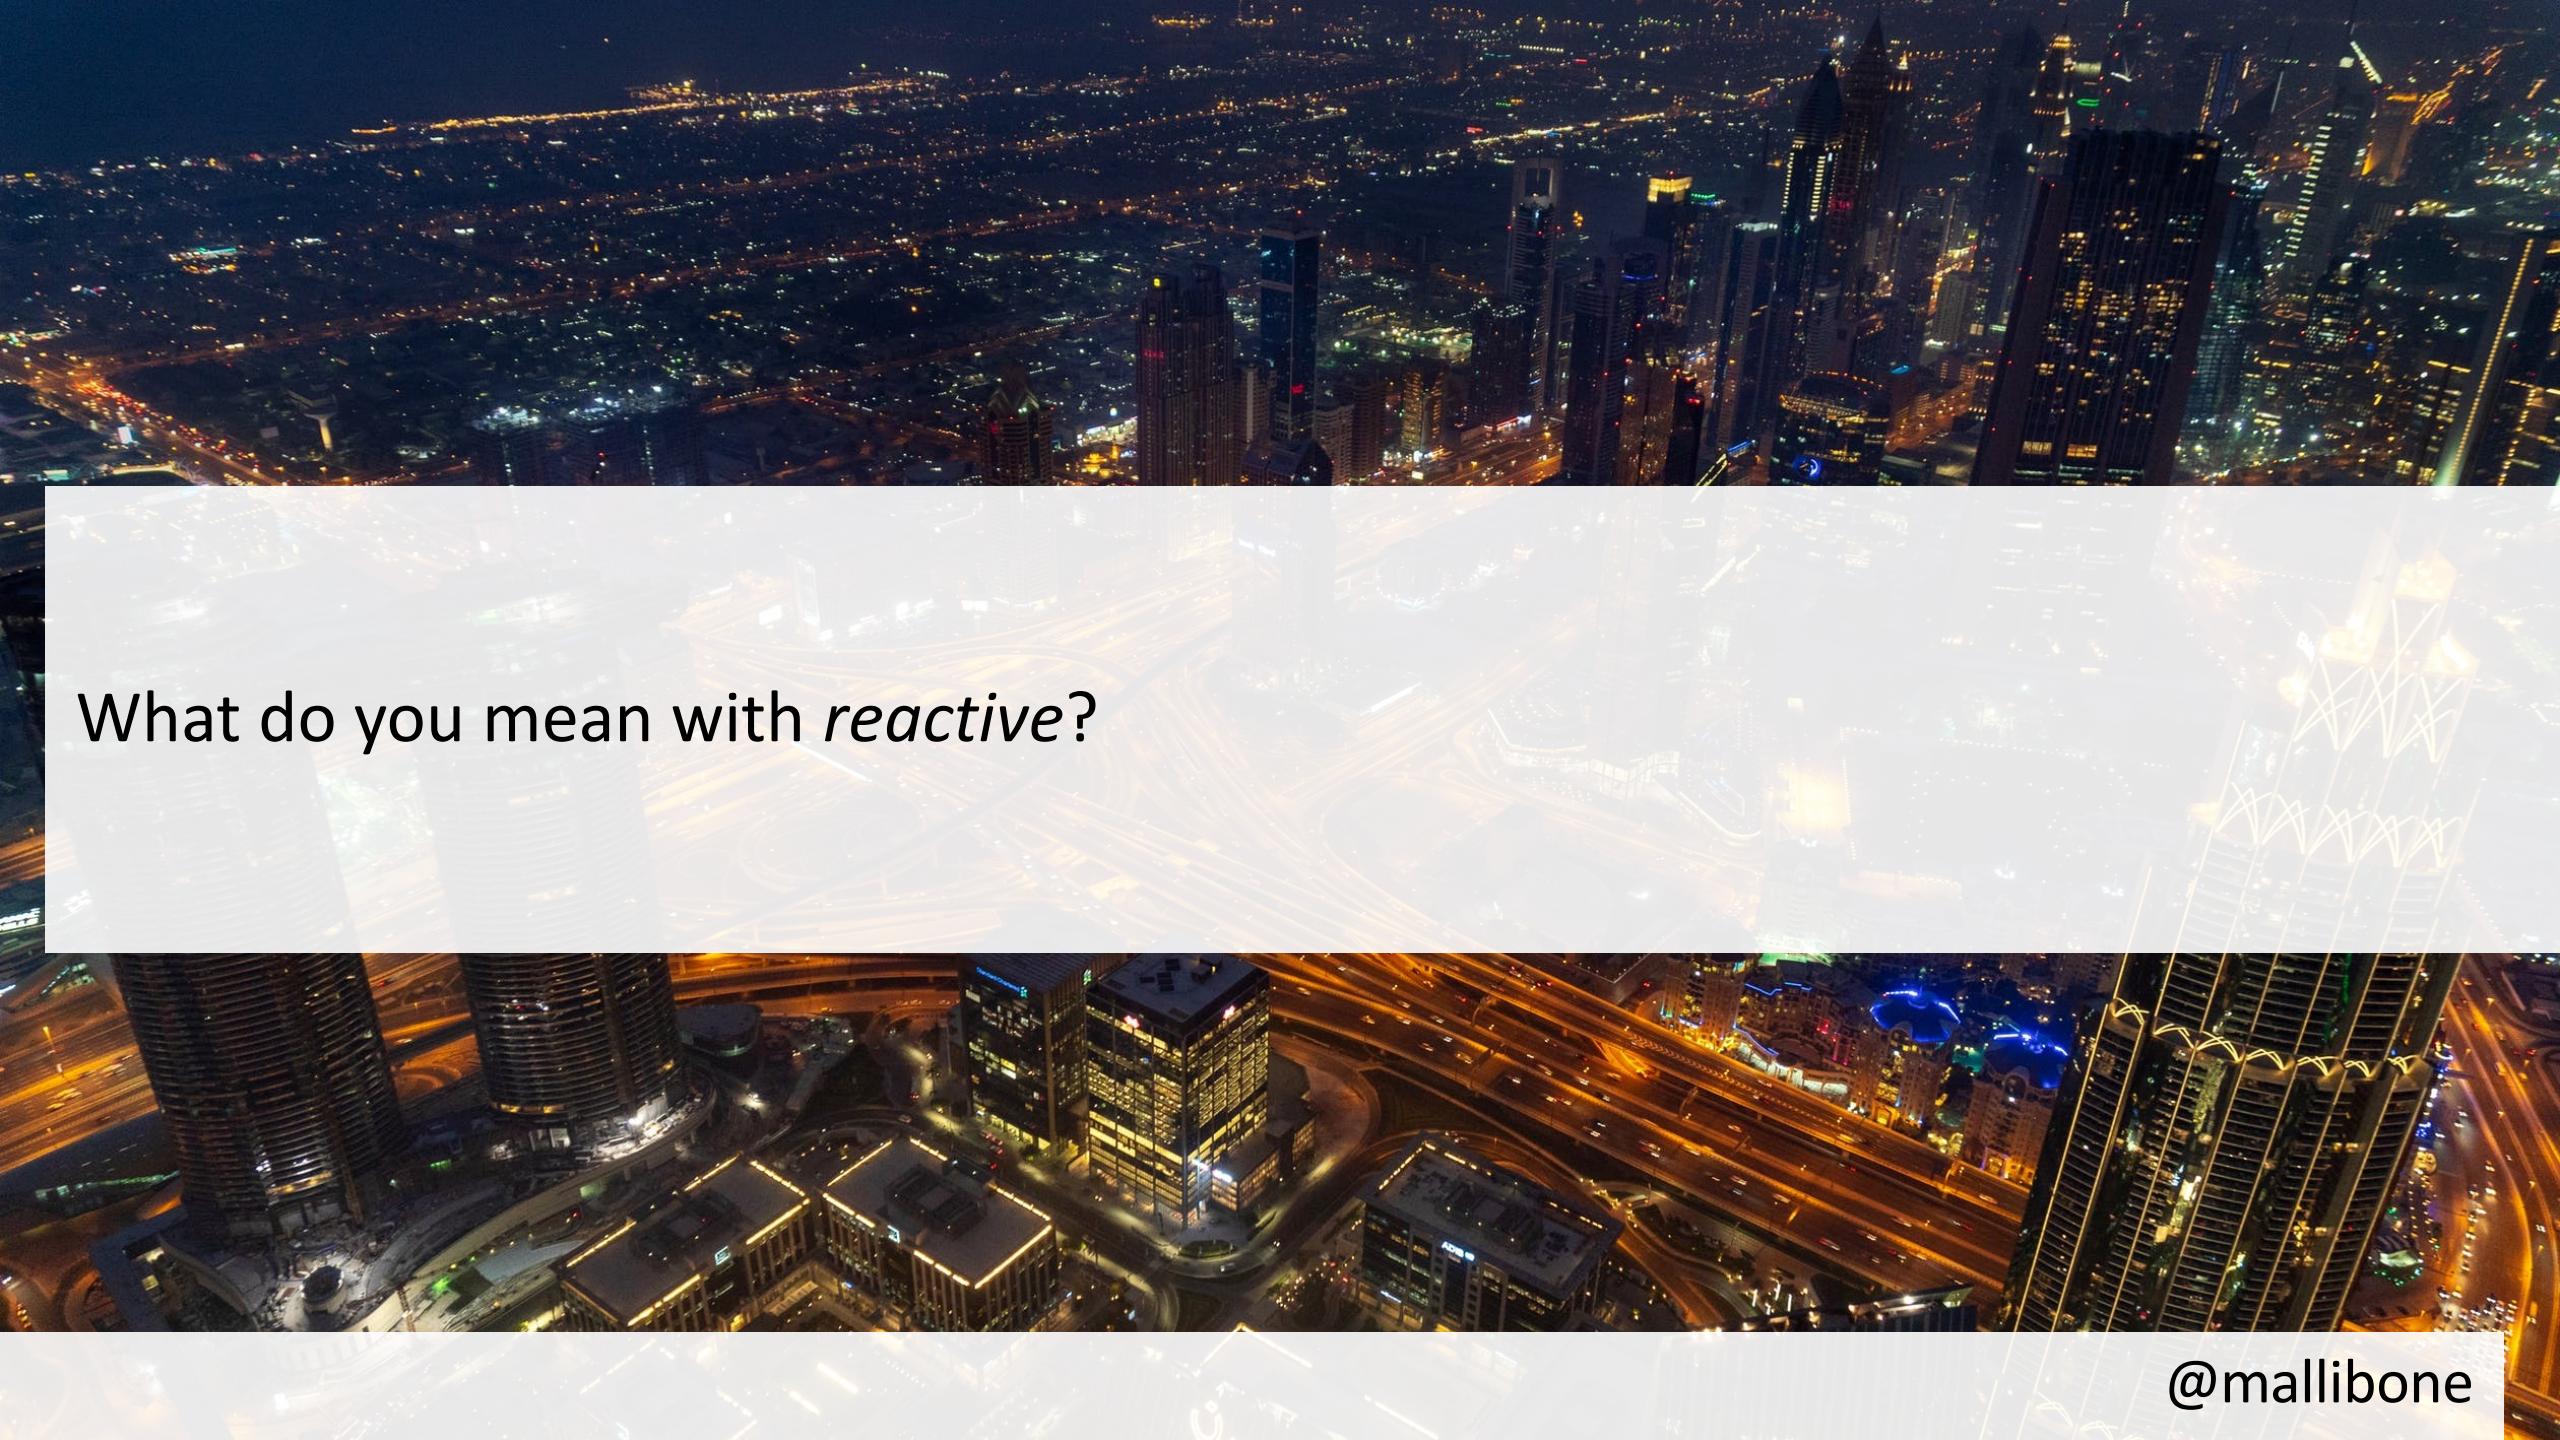

@mallibone

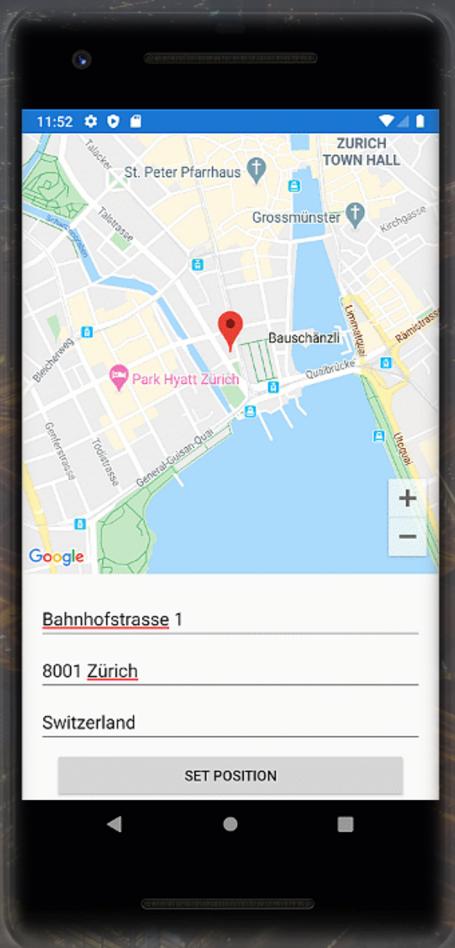

Most actions on a mobile app have a *reactive* nature.

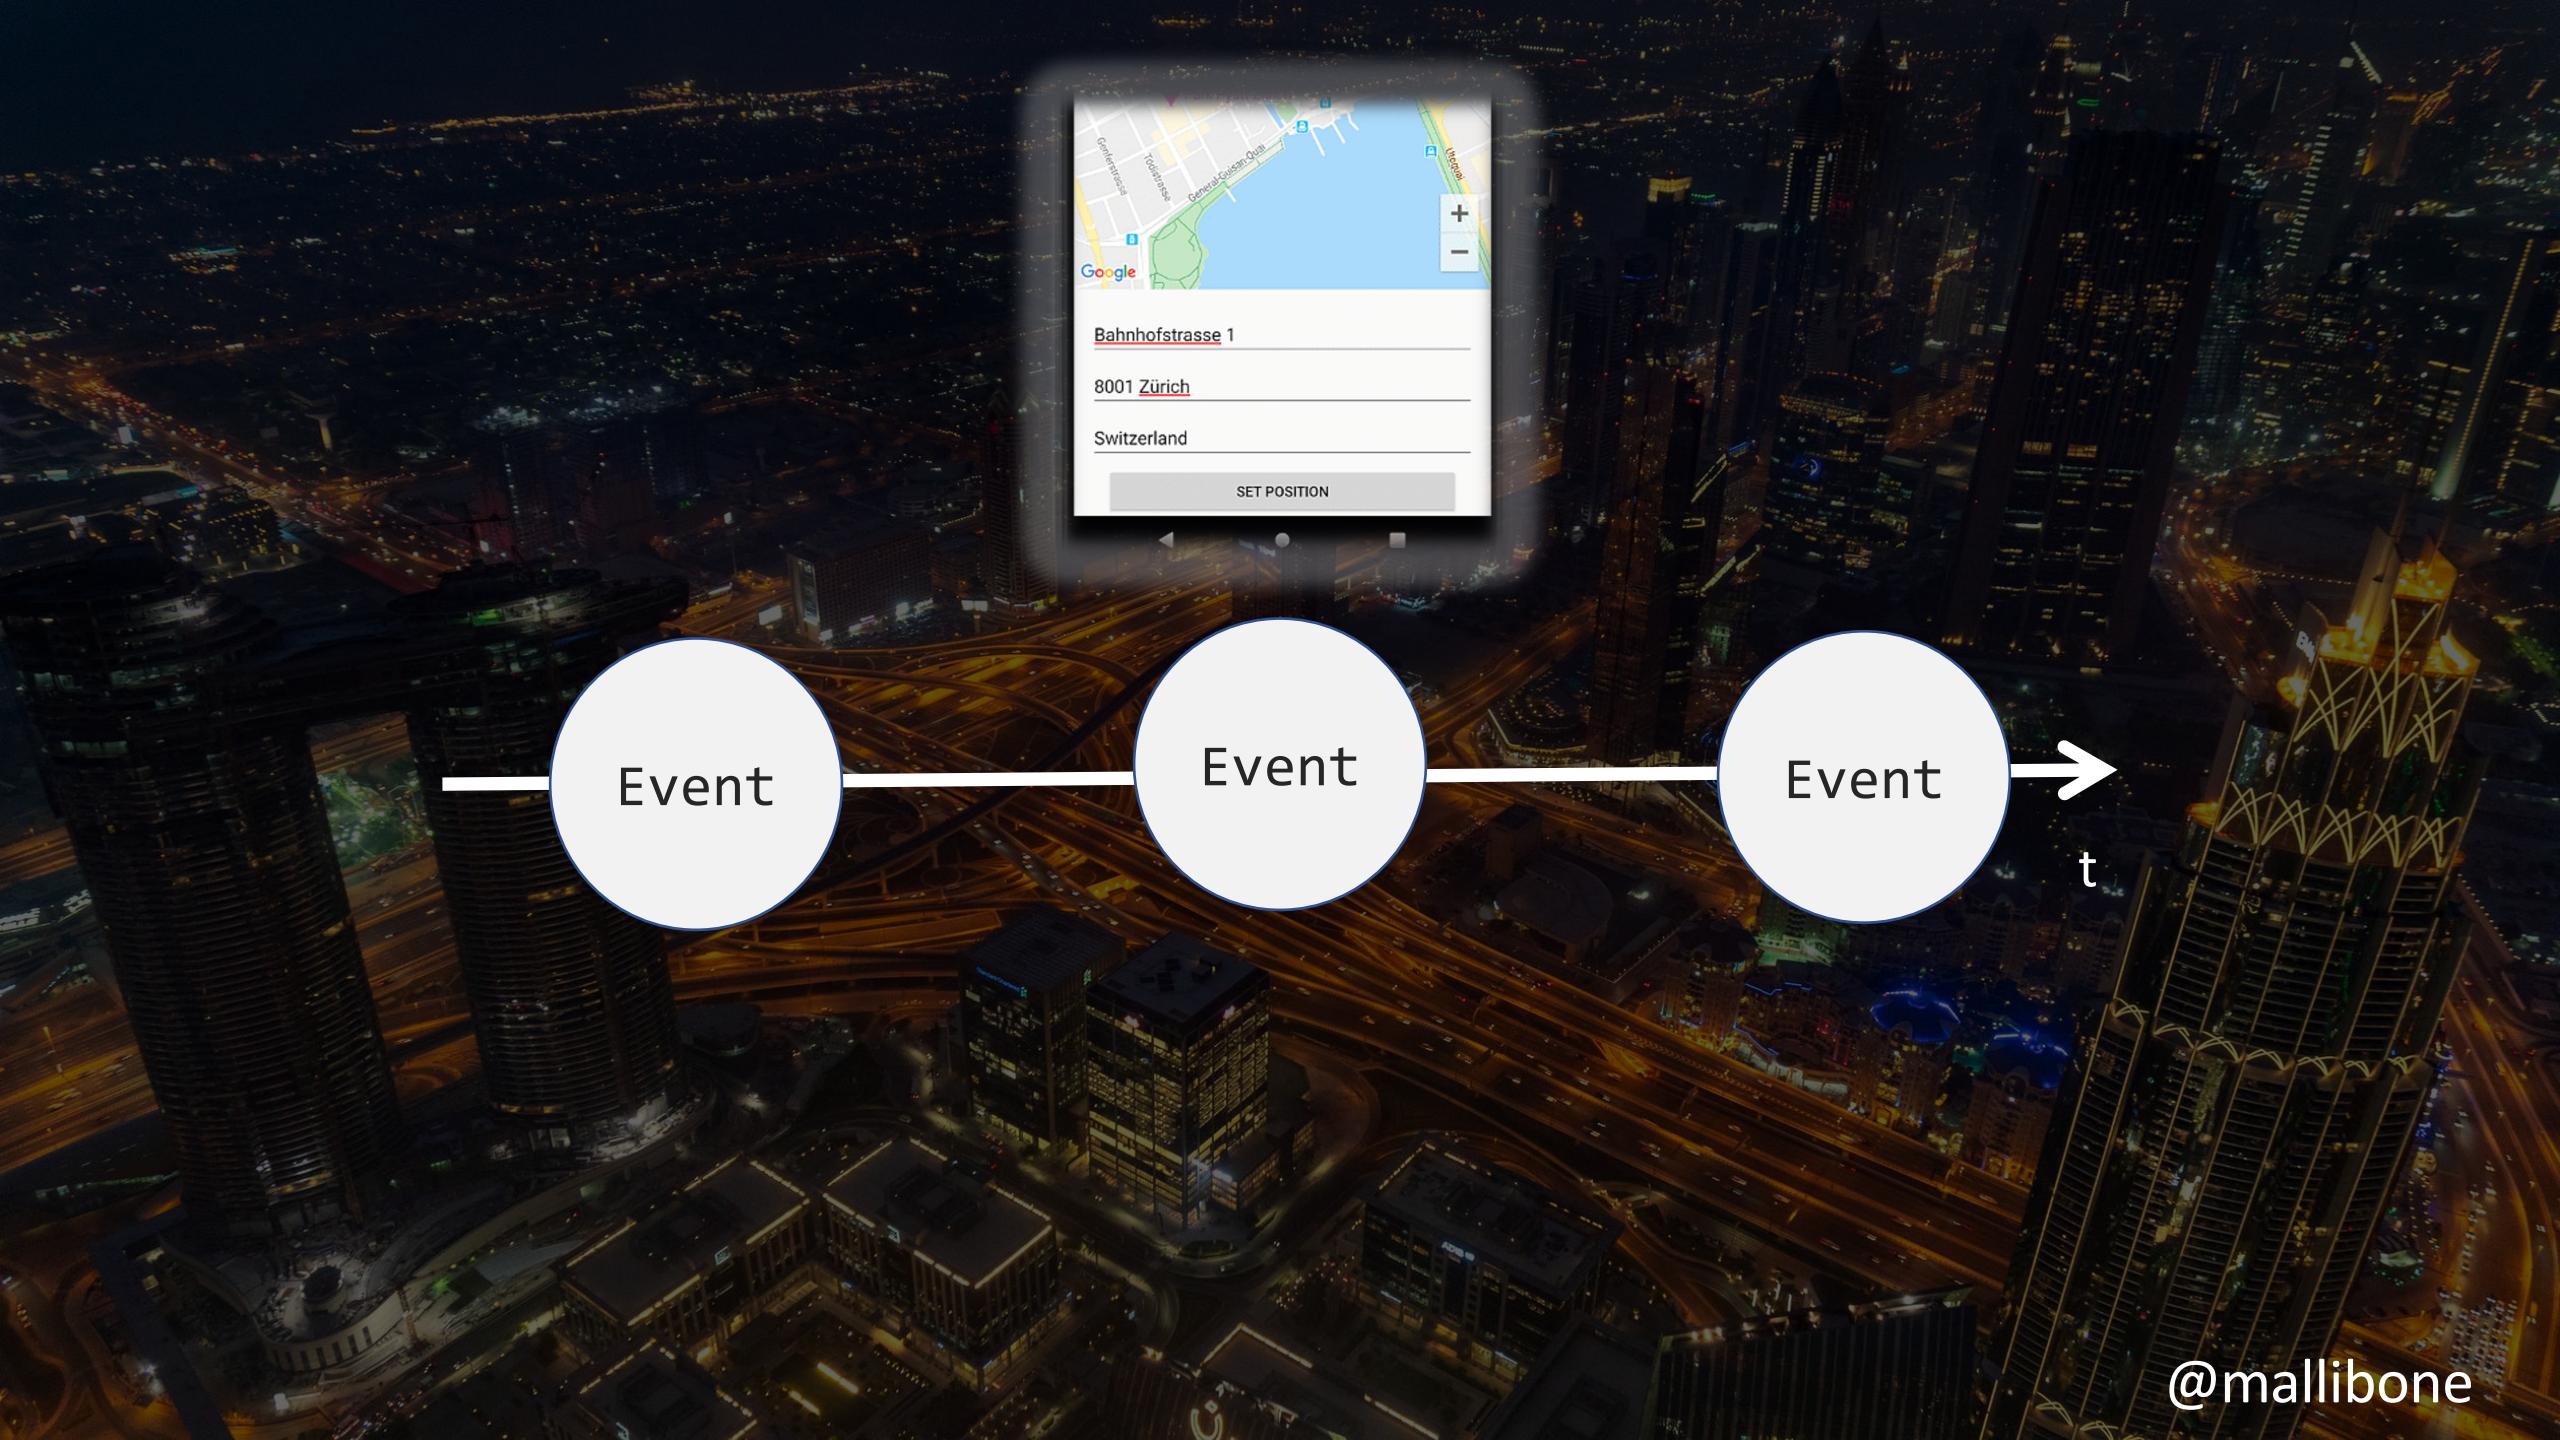

What do you mean with *reactive*?

@mallibone

The screenshot shows a Visual Studio IDE interface with the following details:

- Solution Explorer:** Shows the project structure under "Rx101 · 2 projects".
 - Rx101:** Contains "Dependencies" and "Helpers" (with files: EventSample.cs, MeasurementUpdate.cs, ObservableSample.cs).
 - Rx101.Test:** Contains "Dependencies" and "UnitTests" (with file: UnitTest1.cs).
- Current File:** C# Demo01.cs (selected in the tabs).
- Code Editor:** Displays the following C# code:

```
namespace Rx101
{
    public static class Demo01
    {
        public static void SimpleComparison()
        {
            Console.WriteLine("Simple Event comparison");
            RunEventSample();
            RunObservableSample();
        }

        private static void RunObservableSample()
        {
            var observableSample = new ObservableSample();
            var measurementChangedSubscription:IDisposable =
                observableSample.MeasurementChanged.Subscribe(onNext: update =>
                    Console.WriteLine($"Temperature update {update.CurrentMeasurement}"));
            observableSample.NewMeasurementReading(temperature: 24.0f);
            measurementChangedSubscription.Dispose();
        }

        private static void RunEventSample()
        {
            void EventSampleOnMeasurementChanged(object sender, MeasurementUpdate update) =>
                Console.WriteLine($"Temperature update {update.CurrentMeasurement}");

            var eventSample = new EventSample();
            eventSample.MeasurementChanged += EventSampleOnMeasurementChanged;
            eventSample.NewMeasruementReading(measurement: 22.0f);
            eventSample.MeasurementChanged -= EventSampleOnMeasurementChanged;
        }
    }
}
```
- Status Bar:** Shows build status (1 error), Git integration, and other standard icons.

Demo Recap

- Observables are just event streams
- Completion and Error handling
- Declarative Syntax
- Filter, map etc. like LINQ
- Wrap Events into Observables
- Work with multiple event stream
- Timer e.g. for polling

DON'T FORGET TO

SUBSCRIBE

imgflip.com

@mallibone

```
var observableSample = new ObservableSample();

observableSample
    .MeasurementChanged
    .Where(update => update.CurrentMeasurement > maxTemperature)
    .Subscribe(HandleTemperatureUpdate);
```

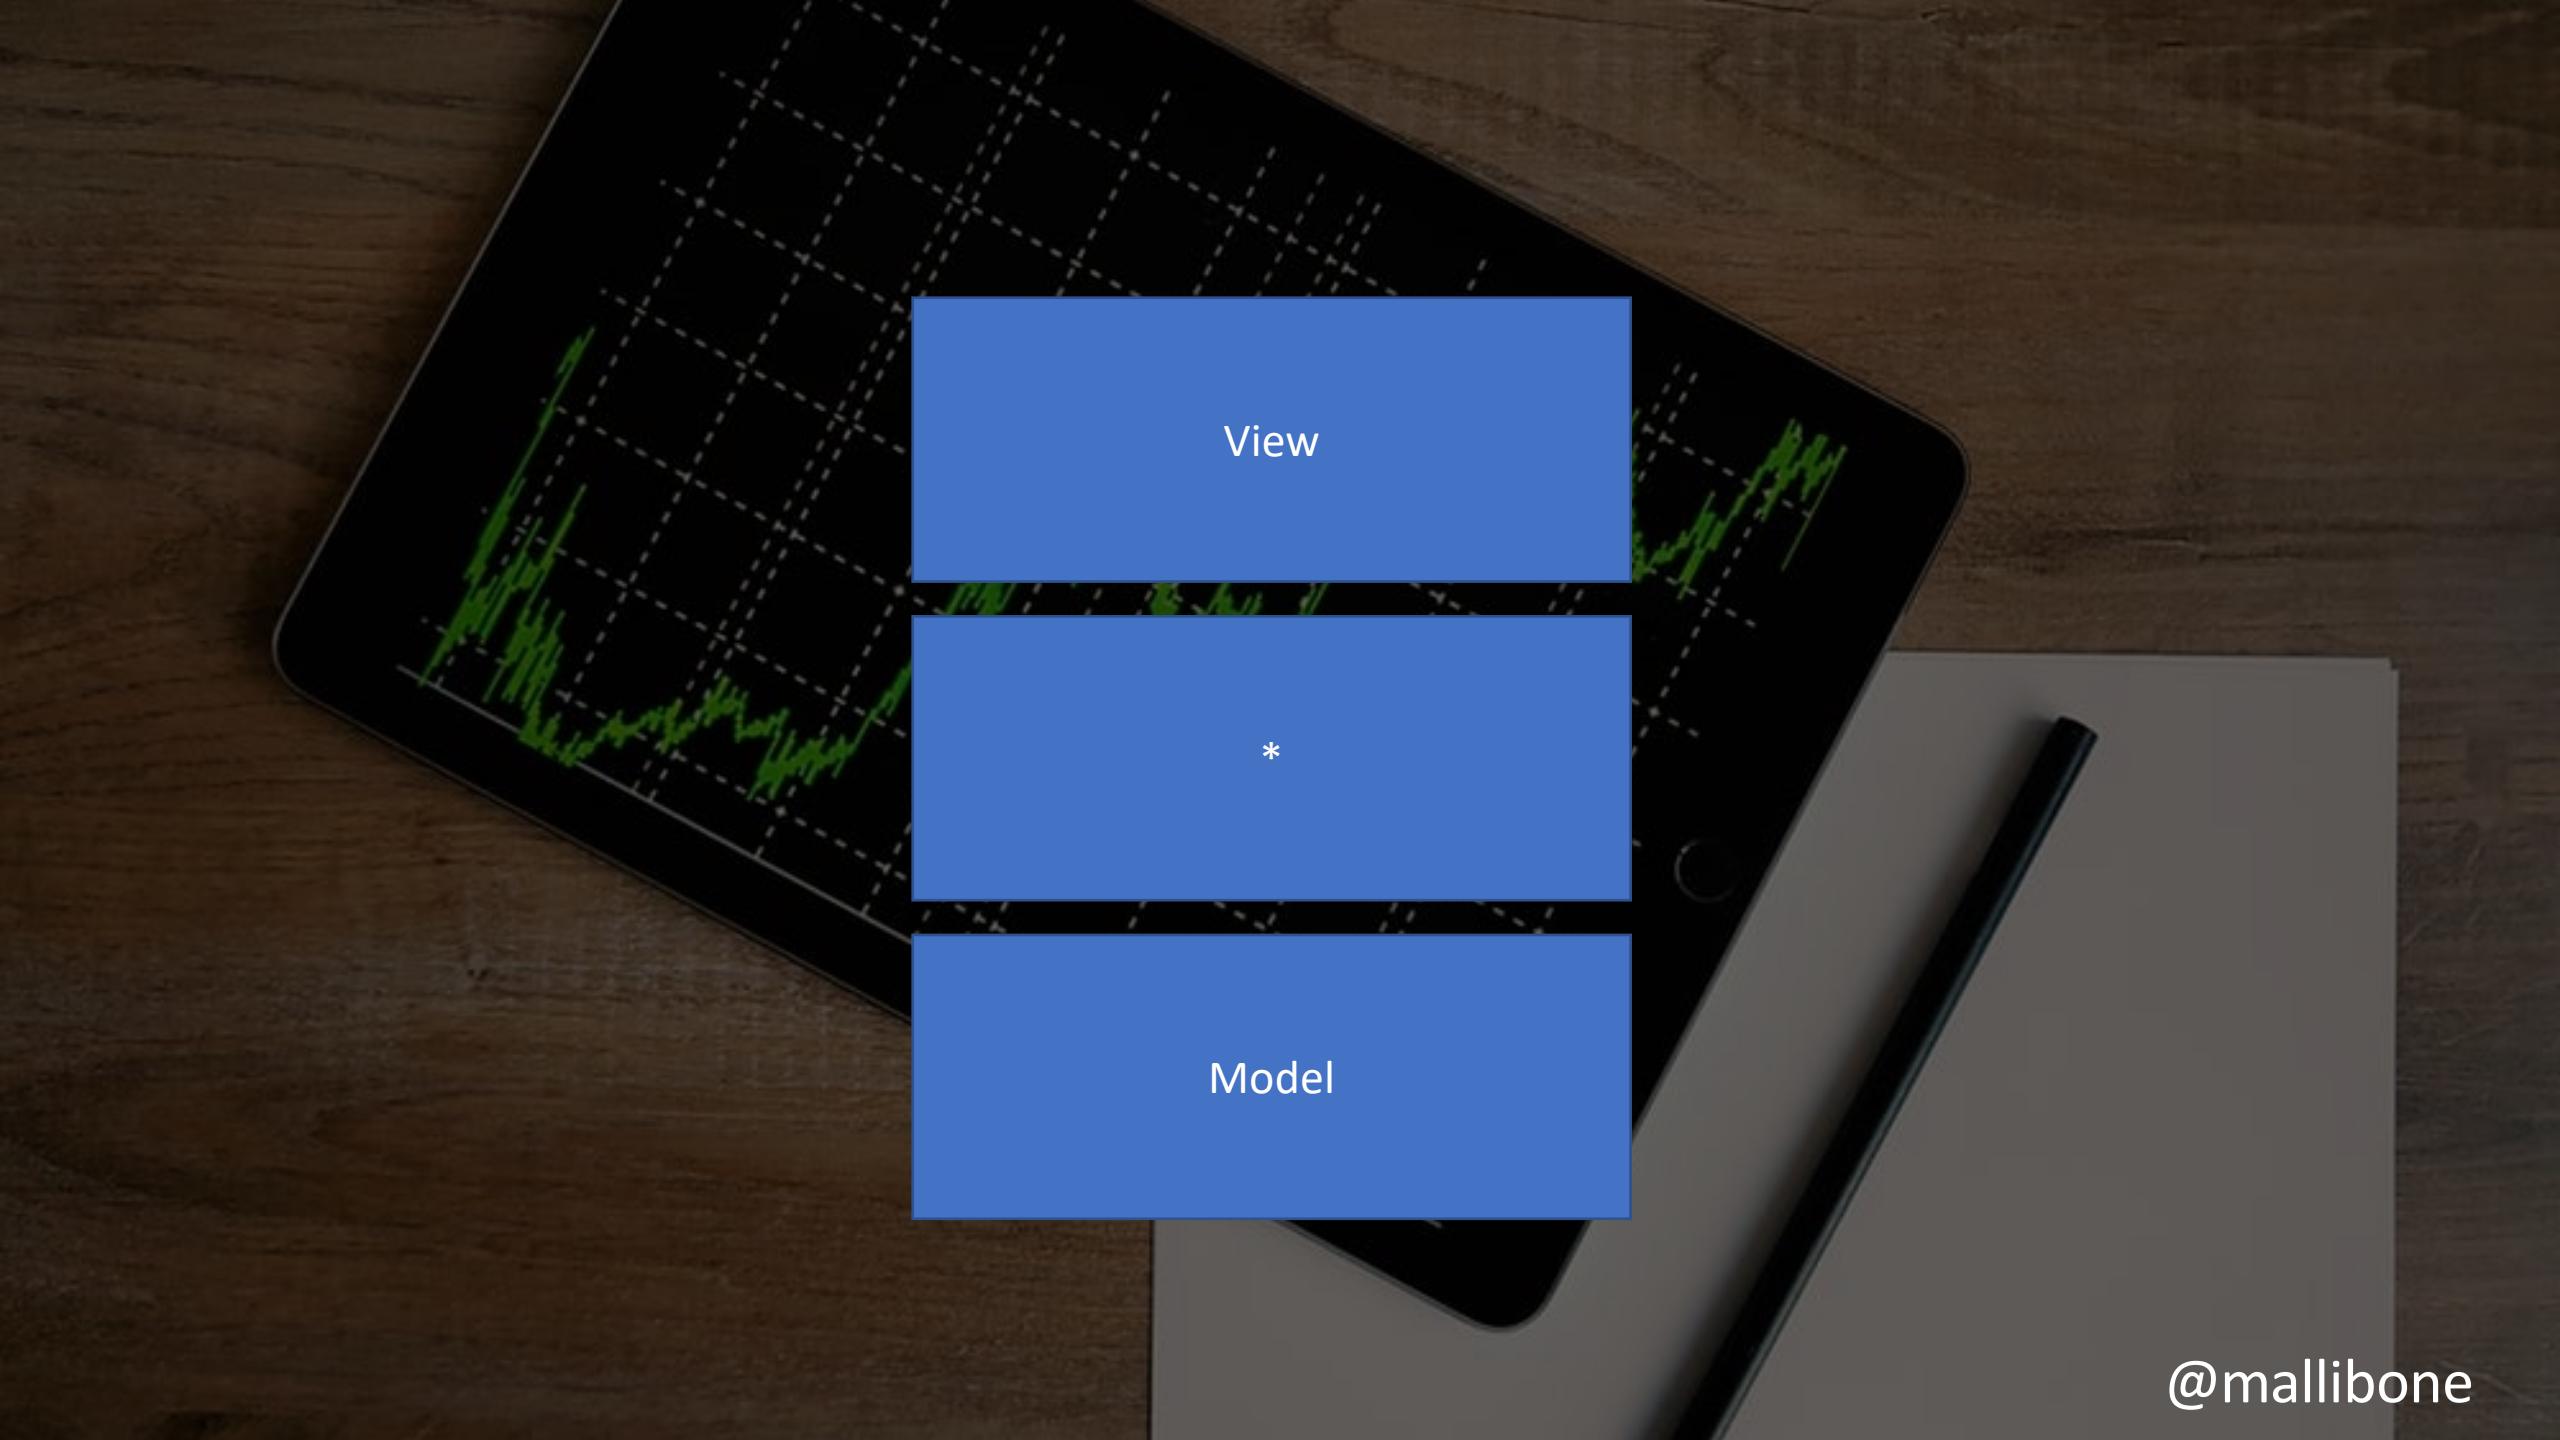

ONE DOES NOT FORGET TO

DISPOSE

ReactiveUI 14.1.1

A MVVM framework that integrates with the Reactive Extensions for .NET to create elegant, testable User Interfaces that run on any mobile or desktop platform. This is the base package with the base platform

ReactiveUI.Fody 14.1.1

Fody extension to generate RaisePropertyChanged notifications for properties and ObservableAsPropertyHelper properties.

ReactiveUI.XamForms 14.1.1

Contains the ReactiveUI platform specific extensions for Xamarin Forms

ReactiveUI.WPF 14.1.1

Contains the ReactiveUI platform specific extensions for Windows Presentation Foundation (WPF)

ReactiveUI.Testing 14.1.1

Provides extensions for testing ReactiveUI based applications

Avalonia.ReactiveUI 0.10.6

Avalonia is a WPF/UWP-inspired cross-platform XAML-based UI framework providing a flexible styling system and supporting a wide range of Operating Systems such as Windows (.NET Framework, .NET

ReactiveUI

A MVVM framework that integrates with the Reactive Extensions for .NET to create elegant, testable User Interfaces that run on any mobile or desktop platform. This is the base package with the base platform implementations

            void EventSampleOnMeasurementChanged(object sender, MeasurementUpdate update) =>
                Console.WriteLine($"Temperature update {update.CurrentMeasurement}");

            var eventSample = new EventSample();
            eventSample.MeasurementChanged += EventSampleOnMeasurementChanged;
            eventSample.NewMeasruementReading(measurement: 22.0f);
            eventSample.MeasurementChanged -= EventSampleOnMeasurementChanged;
        }
    }
}
```
- Status Bar:** Shows build status (1 error), Git integration, and other standard icons.

@mallbone

Demo Recap

- Task has one result
- Observable can have n results
- Akavache uses SQLite (multithreading enabled)
- Seamless Offline experience

@mallibone

Takeaways

Takeaways

- Reactive Extensions (Rx) helps you with everyday development
- Reactive UI brings Rx to the UI through MVVM
- Rx can be used for seamless caching with Akavache
- Don't forget to Subscribe and Dispose

Thank you for your time!
